

For my own purpose I've gathered the list of Dummy sites for freshers/beginners, mostly manual practice, but not exclusively. I hope it'll be helpful.

Dummy Sites and Collections

1. **DemoQA** (<https://demoqa.com/>)
 - This site is quite good for understanding basic concepts such as alerts and frames. However, without a mentor assigning tasks and reviewing results, I wouldn't have known how to test effectively.
2. **WebDriver University** (WebDriverUniversity.com)
 - This one seemed too complex, and I couldn't figure out how to use it. Maybe I didn't try hard enough, or perhaps it is genuinely difficult for beginners.
3. **AcademyBugs** (<https://academybugs.com/>)
 - I found this site very useful, as it offers videos illustrating the bug-finding process. I watched all available content, but there's no opportunity to practice here.
4. **Sauce Demo** (<https://www.saucedemo.com/>)
 - A mobile app with bugs that are easy to spot, but unclear what to do next. There's no feedback on how to document these bugs. I noted them on paper, but what's the next step? Access to the app's code was unclear. I only have an Android phone and don't know how to test on an iPhone.
5. **Ministry of Testing** ([Ministry of Testing](#) | [Ministry of Testing](#))
 - Recommended for its vast amount of training information (in English) and online and offline events, which I plan to attend to enhance my practical skills.
6. **Evil Tester** ([Applications to Practice Testing and Automating - EvilTester.com](#))
 - A resource with links to small applications that can be clicked, tested, and even bugs found. However, it also lacks interactivity and understanding of what and why I am doing it.

Additional Interesting Trainers

1. **QA Trainer Jschool** (<https://qa-trainer-jschool.web.app/>)
 - I found this resource on YouTube, and it meets my initial practice needs. It shows what to test and provides interactive guidance, which is convenient for the learning process. I loved their test case generator with various categories, and no registration is needed. However, it seems to be in the startup phase.
2. **Testing Challenges** (<http://testingchallenges.thetestingmap.org/>)
 - A decent site, but it appears to be no longer maintained. Not all challenges are understandable.
